AEGIS is a very strong choice. I'd actually put it ahead of VECTRA.

It has a technical, futuristic identity without sounding like a fictional chatbot.

AEGIS

Adaptive
Environment for

Interaction &
Spatial Intelligence

Full project identity

AEGIS — Adaptive Environment for Gesture Interaction & Spatial Intelligence

Category: AI-Powered Spatial Computing Platform.

Vision: To create an intelligent computing environment that allows humans to interact naturally with digital information through gestures, voice and spatial interfaces.

1. What AEGIS represents

Pillar	Responsibility
Perception	Understand the physical environment
Vision	Detect and track objects and hands
Interaction	Interpret gestures and movements
Intelligence	Understand commands and context
Spatial Computing	Render and manipulate 3D environments

2. AEGIS architecture

I'd organise the platform into these modules:

```
                AEGIS
     SPATIAL INTELLIGENCE PLATFORM
                    |
    +---------------+---------------+
    |               |               |
    v               v               v
AEGIS.VISION  AEGIS.VOICE  AEGIS.AI
    |               |               |
    v               v               v
Perception    Speech       Intelligence
Tracking      Recognition  Reasoning
    |               |               |
```

```
        +-------------+-------------+
                      |
                      v
               AEGIS.CORE
                      |
               Interaction Engine
                      |
                      v
              AEGIS.SPATIAL
                      |
                3D Environment
```

3. Branding direction

I'd explore:

- **Primary colour:** Midnight navy.
- **Secondary colour:** Electric cyan.
- **Accent:** Silver.
- **Typography:** Modern geometric sans-serif.
- **Logo:** An abstract geometric shield incorporating a spatial or optical element.

The shield concept works particularly well because AEGIS historically refers to protection and defence.

4. Official project description

AEGIS is an AI-powered spatial computing platform designed to redefine human-computer interaction through computer vision, gesture recognition, voice intelligence and interactive 3D environments.

Its goal is to create an environment where digital information can be perceived, manipulated and controlled through natural human interactions.

5. My recommendation

Establish these naming conventions from the beginning:

Component	Name
Platform	AEGIS
Computer Vision	AEGIS Vision
Gesture Engine	AEGIS Motion
Voice Engine	AEGIS Voice
AI Intelligence	AEGIS Intelligence
Spatial Renderer	AEGIS Spatial
Core Runtime	AEGIS Core

Component	Name
Developer Interface	AEGIS SDK

One thing I'd preserve: AEGIS should be the platform, not the assistant's name. The conversational AI can have its own identity later.

That gives you room to build an entire ecosystem around AEGIS.
